	Lawrence B Williams	2634	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *30 January 2006* .

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1,5-13,15,16 and 20-26* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1,5-13,15,16 and 20-26* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☒ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

11)☐ The proposed drawing correction filed on _____ is: a)☐ approved b)☐ disapproved by the Examiner.

If approved, corrected drawings are required in reply to this Office action.

12)☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

13)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____ .

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

14)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

a) ☐ The translation of the foreign language provisional application has been received.

15)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____ .
4) ☐ Interview Summary (PTO-413) Paper No(s). _____ .
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: .

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1, 5-13, 15-16, 20-25 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

3. Claims 1, 11-13, 21 are rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Luz et al. (US Patent 6,088,399).

(1) With regard to claim 1, Luz et al. a method for receiving a signal, said method comprising the steps of receiving an RF signal, said RF signal comprising a plurality of information channel signals each comprising different code division multiple access data spread using a different spreading codes, wherein each of said plurality of information channel signals are transmitted in one of a plurality of transmission bands, and each of said plurality of information channel signals is carried on one of a plurality of carrier frequencies; down-converting said RF signal to form an intermediate signals wherein said intermediate signal comprises: down-converted versions of each of said plurality of information channel signals, and said down-converted versions of each of the plurality of information channel signals are

generated from a plurality of frequencies and said down-converted versions of each of said plurality of information channel signals are within a common frequency spectrum; and decoding said intermediate signal to extract data from said down-converted versions of each of said plurality of information channel signals (col. 1, lines 25-51). Luz et al. does not explicitly use the term intermediate signal but does teach the three separate frequency bands being down converted to a single frequency (col. 1, lines 64-48) which would inherently include down converted to an intermediate signal to one of ordinary skill in the art. Luz et al. discloses that multicarrier transmission transmits information over the bandwidth of interest (col. lines 27-30), which would inherently ensure that the information signals are within a common frequency spectrum. Though Luz et al. does not use the term decoding, he does teach despreading the signal paths with separate despreaders using a unique Walsh code, which would, corresponds to applicant's decoding to extract data.

(2) With regard to claim 11, though Luz et al. is silent on the subject of receiving an RF signal from a cellular base station, he does teach the use of the invention in cellular communication **systems** (col. 1, lines 20-24) which would inherently include a base station.

(3) With regard to claim 12, Luz et al. also discloses in Fig. 1, the method of claim 1 further comprising the step of filtering said intermediate signal to attenuate at least one signal outside the common frequency spectrum before performing said step of down-converting.

(4) With regard to claim 13, Luz et al. discloses in Fig. 1, a mobile radio telephone unit comprising: an antenna configured to receive an RF signal, said RF signal comprising a plurality of information channel signals each comprising different code division multiple access data spread using a different spreading codes, wherein each of said plurality of information channel

signals are transmitted in one of a plurality of transmission bands, and each of said plurality of information channel signals is carried on one of a plurality of carrier frequencies; down-converting said RF signal to form an intermediate signals wherein said intermediate signal comprises: down-converted versions of each of said plurality of information channel signals, and said down-converted versions of each of the plurality of information channel signals are generated from a plurality of frequencies and said down-converted versions of each of said plurality of information channel signals are within a common frequency spectrum; and decoding said intermediate signal to extract data from said down-converted versions of each of said plurality of information channel signals (col. 1, lines 25-51). Luz et al. does not explicitly use the term intermediate signal but does teach the three separate frequency bands being down converted to a single frequency (col. 1, lines 64-48) which would inherently include down converted to an intermediate signal to one of ordinary skill in the art. Luz et al. discloses that multicarrier transmission transmits information over the bandwidth of interest (col. lines 27-30), which would inherently ensure that the information signals are within a common frequency spectrum. Though Luz et al. does not use the term decoding, he does teach despreading the signal paths with separate despreaders using a unique Walsh code, which would, corresponds to applicant's decoding to extract data.

(5) With regard to claim 21, claim 21 discloses limitations similar to those disclosed in claim 1. Therefore a similar rejection applies.

4. Claims 5-6, 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) as applied to claims 1 and 13 in view of Yokev et al. (US Patent 5,499,266).

(1) With regard to claim 5, as noted above, Luz et al. discloses all limitations of claim 1 above. Luz et al. doe not however disclose wherein said step of down-converting comprises down-converting each of said plurality of carrier frequencies by a plurality of oscillator frequencies.

However, Yokev et al. teaches setting a local oscillator signal to a frequency selected from a given plurality of local oscillator frequencies (col. 19, line 65-col. 20, line 7).

It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

(2) With regard to claim 6, Yokev et al. also teaches wherein the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same (col. 19, lines 23-34). It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

(3) With regard to claim 15, claim 15 inherits all limitations of claim 13 above. Furthermore, claim 15 discloses limitations similar to those disclosed in claim 5, therefore a similar rejection applies.

(4) With regard to claim 16, claim 16 inherits all limitations of claim 13. Furthermore, claim 16 discloses limitations similar to those disclosed in claim 6. Therefore a similar rejection applies.

5. Claims 7-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) as applied to claim 1 in view of Bell, III et al. (US Patent 6,088,348).

(1) With regard to claim 7, claim 7 inherits all limitations of claim 1 above. As noted above, Luz et al. discloses all limitations of claim 1. He does not however, teach wherein said common frequency spectrum comprises a first common frequency spectrum, and the step of decoding said intermediate signal comprises the step of forming a base band signal by down-converting said first common frequency spectrum to a second common frequency spectrum, said second common frequency spectrum lower in frequency than said first common frequency spectrum.

However, Bell, III et al. teaches wherein said common frequency spectrum comprises a first common frequency spectrum (PCS 1930-1990 MHz), and the step of decoding said intermediate signal comprises the step of forming a base band signal by down-converting said first common frequency spectrum to a second common frequency spectrum (~210.38 MHz), said second common frequency spectrum lower in frequency than said first common frequency spectrum.

Bell, III et al. teaches in Fig. 5, down converting both the PCS and GPS signals to an intermediate signal to a spectrum in the 210.38 MHz range (col. 6, lines 21-31). Then subsequent processing of the IF signal takes place (col. 6, lines 1-6), which would inherently include forming a baseband signal and decoding of the information, contained in the received signal.

It would have been obvious to one skilled in the art at the time of invention to incorporate the teachings of Bell, III et al. as a method of implementing a system to effectively support wireless communications operating in two or three distinct frequency bands (col. 3, lines 17-20).

(2) With regard to claim 8, Bell, III et al. also discloses down-converting the intermediate signal using a first oscillator signal (1769.62-1779.62 MHz) to form a first base band component signal and a second oscillator signal (1785.80 MHz) to form a second base band component signal, the first and second oscillator signals each at a same frequency.

Bell, II, et al. discloses the first oscillator reference signal over a range which includes the 1785.80 MHz used for the second oscillator signal (same frequency). Though Bell, III et al. is silent as to the oscillator signals being at a different phase, it would be obvious to one skilled in the art that the signals would need to be out of phase to adequately distinguish the PCS signal from the GPS signal given that they are both contained in the down converted 210.38 MHz signal.

It would have been obvious to one skilled in the art at the time of invention to incorporate the teachings of Bell, III et al. as a method of implementing a system to effectively support wireless communications operating in two or three distinct frequency bands (col. 3, lines 17-20).

6. Claims 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) view of Bell, III et al. (US Patent 6,088,348) as applied to claim 8 in further view of Applicant's Admitted Prior Art.

(1) With regard to claim 9, claim 9 inherits all limitations of claim 8 above. As noted above, Luz et al. in combination with Bell, III et al. disclose all limitations of claim 8. They do not however disclose wherein said first base band component comprises a first folded signal and said second base band component comprises a second folded signal, each folded signal having a frequency spectrum narrower than said first common frequency spectrum.

However, Applicant's Admitted Prior Art teaches wherein said first base band component comprises a first folded signal and said second base band component comprises a second folded signal, each folded signal having a frequency spectrum narrower than said first common frequency spectrum (p4. 4, lines 17-25).

It would have been obvious to one skilled in the art at the time of invention to incorporate the teachings of the prior art as a known method step in implementing a multimode receiver.

(2) With regard to claim 10, Applicant's Admitted Prior Art also teaches in Fig. 3, the steps of sampling (311) said first base band component to form a first digital representation; sampling (315) said second base band component to form a second digital representation; and combining said first and said second digital representations to form an unfolded signal, said unfolded signal having a frequency spectrum greater than the spectrum of the first folded signal.

It would have been obvious to one skilled in the art at the time of invention to incorporate the teachings of the prior art as a known method step in implementing a multimode receiver.

7. Claim 20 is rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Bell, III et al. (US Patent 6,088,348).

Bell discloses in Fig. 5, a CDMA receiver for operating in at least a first mode and a second mode, said CDMA receiver comprising: an initial RF stage (512, 514; 532, 534), said initial RF stage for outputting a received RF signal; an oscillator (554), said oscillator for generating a plurality of oscillator signals, each at a different frequency, when the receiver operates in the first mode and generating a single oscillator signal when the receiver operates in the second mode (col. 6, lines 21-31); a down-converter coupled to said initial RF stage and said oscillator, said down-converter for receiving said received RF signal and multiplying said RF signal by said plurality of oscillator signals (PCS, 1719.62-1779.62) when the receiver operates in the first mode, and multiplying said RF signal by said single oscillator signal (1785.80 MHz)when the receiver operates in the second mode, to generate an intermediate signal. Though Bell, III et al. is silent on the subject of a base band stage, coupled to said down-converter, said base band stage for processing said intermediate signal, he does teach the complexity of subsequent processing of the intermediate signal being minimized (col. 6, lines 1-6). A baseband section for subsequent processing would be readily apparent to one of ordinary skill in the art. Though Bell, is silent on the term CDMA, he does teach that the receiver subsystem is readily applicable to wireless communication devices, including mobile phones which subscribe to Cellular (col. 6, lines 6-9).

8. Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) as applied to claim 21 above and further in view of Yokev et al. (US Patent 5,499,266).

As noted above, Luz et al. discloses all limitations of claim 21 above. Luz et al. does not however disclose wherein said down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies, the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same.

However, Yokev et al. discloses wherein a down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies (col. 19, line 65-col. 20, line 7), the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same (col. 19, lines 23-34). It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

9. Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) in view of Shamlou et al. (US Patent 6,690,949 B1).

Luz et al. discloses in Fig. 1, a receiver to receive an RF signal, said RF signal comprising a plurality of information channel signals each comprising different code division multiple access data spread using a different spreading codes, wherein each of said plurality of information channel signals are transmitted in one of a plurality of transmission bands, and each

of said plurality of information channel signals is carried on one of a plurality of carrier frequencies; down-converting said RF signal to from an intermediate signals wherein said intermediate signal comprises: down-converted versions of each of said plurality of information channel signals, and said down-converted versions of each of the plurality of information channel signals are generated from a plurality of frequencies and said down-converted versions of each of said plurality of information channel signals are within a common frequency spectrum; and decoding said intermediate signal to extract data from said down-converted versions of each of said plurality of information channel signals (col. 1, lines 25-51). Luz et al. does not explicitly use the term intermediate signal but does teach the three separate frequency bands being down converted to a single frequency (col. 1, lines 64-48) which would inherently include down converted to an intermediate signal to one of ordinary skill in the art. Luz et al. discloses that multicarrier transmission transmits information over the bandwidth of interest (col. lines 27-30), which would inherently ensure that the information signals are within a common frequency spectrum. Though Luz et al. does not use the term decoding, he does teach despreading the signal paths with separate despreaders using a unique Walsh code, which would, corresponds to applicant's decoding to extract data.

Luz et al. does not however disclose the receiver and down-converter as a chip apparatus. However, Shamlou et al. discloses a system for supporting multiple wireless standards with a single circuit architecture (col. 2, lines 30-34). It would have been obvious to one skilled in the art at the time of invention to combine the teachings of Shamlou et al. with the teaching of Luz et al. to minimize size weight, complexity, power consumption and cost (col. 2, lines 30-34).

10. Claim 24 is rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) in view of in view of Shamlou et al. (US Patent 6,690,949 B1) as applied to claim 23 above and further in view of Yokev et al. (US Patent 5,499,266).

As noted above, Luz et al. in combination with Shamlou et al. discloses all limitations of claim 23 above. They do not however disclose wherein said down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies, the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same.

However, Yokev et al. discloses wherein said down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies (col. 19, line 65-col. 20, line 7), the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same (col. 19, lines 23-34). It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

11. Claim 25 is rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Luz et al. (US Patent 6,088,399).

Luz et al. discloses in Fig. 1, an apparatus comprising: means (121) for receiving an RF signal, said RF signal comprising a plurality of information channel signals each comprising different code division multiple access data spread using a different spreading code, wherein each of said plurality of information channel signals are transmitted in one of a plurality of

transmission bands, and each of said plurality of information channel signals is carried on one of a plurality of carrier frequencies; and means (125) for down-converting said RF signal to form an intermediate signal, wherein said intermediate signal comprises down-converted versions of each of said plurality of information channel signals, and said down-converted versions of each of said plurality of information channel signals are generated from a plurality of frequencies, said down-converted versions of each of said plurality of information channel signals are within a common frequency spectrum (col. 1, lines 25-51). Luz et al. does not explicitly use the term intermediate signal but does teach the three separate frequency bands being down converted to a single frequency (col. 1, lines 64-48) which would inherently include down converted to an intermediate signal to one of ordinary skill in the art. Luz et al. discloses that multicarrier transmission transmits information over the bandwidth of interest (col. lines 27-30), which would inherently ensure that the information signals are within a common frequency spectrum. Though Luz et al. does not use the term decoding, he does teach despreading the signal paths with separate despreaders using a unique Walsh code, which would, corresponds to applicant's decoding to extract data.

12. Claim 26 is rejected under 35 U.S.C. 103(a) as being unpatentable over Luz et al. (US Patent 6,088,399) as applied to claim 25 above and further in view of Yokev et al. (US Patent 5,499,266).

As noted above, Luz et al. in combination with Smith et al. discloses all limitations of claim 25 above. Luz et al. doe not however disclose wherein said down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies, the

frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same.

However, Yokev et al. discloses wherein said down–converter comprises an oscillator for generating an oscillator signal comprising a plurality of oscillator frequencies (col. 19, line 65-col. 20, line 7), the frequency spacing between each adjacent pair of said plurality of carrier frequencies and between each adjacent pair of said oscillator frequencies is substantially the same (col. 19, lines 23-34).

It would have been obvious to one skilled in the art at the time of invention to incorporate the teaching of Yokev et al. as a method of translating each of the carrier frequencies to a specific pass band dependent upon the oscillator frequency.

Conclusion

13. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

a.) Sarraf et al. discloses in US Patent 6,747,948 B1 Interleaver Scheme In An OFDM System With Multiple-Stream Data Sources.

b.) Proctor, Jr. discloses in US Patent 6,614,776 B1 Forward Error Correction Scheme For High Rate Data Exchange In A Wireless System.

c.) Gavrilovich discloses in US Patent 5,771,229 Method, System And Mobile Communication Unit For Communicating Over Multiple Channels In A Wireless Communication System.

d.) Na discloses in US Patent 5,999,824 Radio Signal Processing Apparatus Of Portable Telephone For Sharing Digital/Analog Compatible Mode And Personal Communication Service Mode.

e.) Oishi et al. discloses in US Patent 6,563,859 B1 Receiver And Receiving Method In Multi-Carrier Spread-Spectrum Communications.

f.) Gu discloses in US Patent 6,631,170 B1 Radio Frequency Receiver.

g.) Ritter discloses in US Patent 6,289,221 B1 Mobile Radio Telephone System.

h.) Gore et al. discloses in US Patent 6,308,048 B1 Simplified Reference Frequency Distribution In A Mobile Phone.

i.) Damgaard et al. discloses in US Patent 6,208,875 B1 RF Architecture For Cellular Dual-Band Telephone.

14. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Lawrence B Williams whose telephone number is 571-272-3037. The examiner can normally be reached on Monday-Friday (8:00-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ghayour Mohammad can be reached on 571-272-3021. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
